Start-Up and Service Instructions

SAFETY CONSIDERATIONS

Centrifugal liquid chillers are designed to provide safe and reliable service when operated within design specifications. When operating this equipment, use good judgment and safety precautions to avoid damage to equipment and property or injury to personnel.

Be sure you understand and follow the procedures and safety precautions contained in the machine instructions, as well as those listed in this guide.

DANGER

Failure to follow these procedures will result in severe personal injury or death.

DO NOT VENT refrigerant relief devices within a building. Outlet from rupture disc or relief valve must be vented outdoors in accordance with the latest edition of ANSI/ASHRAE 15 (American National Standards Institute/American Society of Heating, Refrigerating and Air-Conditioning Engineers) (Safety Code for Mechanical Refrigeration). The accumulation of refrigerant in an enclosed space can displace oxygen and cause asphyxiation.

PROVIDE adequate ventilation in accordance with ANSI/ASHRAE 15, especially for enclosed and low overhead spaces. Inhalation of high concentrations of vapor is harmful and may cause heart irregularities, unconsciousness, or death. Intentional misuse can be fatal. Vapor is heavier than air and reduces the amount of oxygen available for breathing. Product causes eye and skin irritation. Decomposition products are hazardous.

DO NOT USE OXYGEN to purge lines or to pressurize a machine for any purpose. Oxygen gas reacts violently with oil, grease, and other common substances.

NEVER EXCEED specified test pressures. VERIFY the allowable test pressure by checking the instruction literature and the design pressures on the equipment nameplate.

DO NOT VALVE OFF any safety device.

BE SURE that all pressure relief devices are properly installed and functioning before operating any machine.

RISK OF INJURY OR DEATH by electrocution. High voltage is present on motor leads even though the motor is not running when a solid state or inside-delta mechanical starter is used. Open the power supply disconnect before touching motor leads or terminals.

WARNING

Failure to follow these procedures may result in personal injury or death.

DO NOT USE TORCH to remove any component. System contains oil and refrigerant under pressure.

To remove a component, wear protective gloves and goggles and proceed as follows:

a. Shut off electrical power to unit.

b. Recover refrigerant to relieve all pressure from system using both high-pressure and low pressure ports.

c. Traces of vapor should be displaced with nitrogen and the work area should be well ventilated. Refrigerant in contact with an open flame produces toxic gases.

d. Cut component connection tubing with tubing cutter and remove component from unit. Use a pan to catch any oil that may come out of the lines and as a gage for how much oil to add to the system.

e. Carefully unsweat remaining tubing stubs when necessary. Oil can ignite when exposed to torch flame.

DO NOT USE eyebolts or eyebolt holes to rig machine sections or the entire assembly.

DO NOT work on high-voltage equipment unless you are a qualified electrician.

DO NOT WORK ON electrical components, including control panels, switches, starters, or oil heater until you are sure ALL POWER IS OFF and no residual voltage can leak from capacitors or solid-state components.

LOCK OPEN AND TAG electrical circuits during servicing. IF WORK IS INTERRUPTED, confirm that all circuits are de-energized before resuming work.

AVOID SPILLING liquid refrigerant on skin or getting it into the eyes. USE SAFETY GOGGLES. Wash any spills from the skin with soap and water. If liquid refrigerant enters the eyes, IMMEDIATELY FLUSH EYES with water and consult a physician.

NEVER APPLY an open flame or live steam to a refrigerant cylinder. Dangerous over pressure can result. When it is necessary to heat refrigerant, use only warm (110 F [43 C]) water.

DO NOT REUSE disposable (nonreturnable) cylinders or attempt to refill them. It is DANGEROUS AND ILLEGAL. When cylinder is emptied, evacuate remaining gas pressure, loosen the collar, and unscrew and discard the valve stem. DO NOT INCINERATE.

CHECK THE REFRIGERANT TYPE before adding refrigerant to the machine. The introduction of the wrong refrigerant can cause machine damage or malfunction.

(Warnings continued on next page.)
Operation of this equipment with refrigerants other than those cited herein should comply with ANSI/ASHRAE 15 (latest edition). Contact Carrier for further information on use of this machine with other refrigerants.

DO NOT ATTEMPT TO REMOVE fittings, covers, etc., while machine is under pressure or while machine is running. Be sure pressure is at 0 psig (0 kPa) before breaking any refrigerant connection.

CAREFULLY INSPECT all relief valves, rupture discs, and other relief devices AT LEAST_ONCE A YEAR. If machine operates in a corrosive atmosphere, inspect the devices at more frequent intervals.

DO NOT ATTEMPT TO REPAIR OR RECONDITION any relief valve when corrosion or build-up of foreign material (rust, dirt, scale, etc.) is found within the valve body or mechanism. Replace the valve.

DO NOT install relief devices in series or backwards.

USE CARE when working near or in line with a compressed spring. Sudden release of the spring can cause it and objects in its path to act as projectiles.

Failure to follow these procedures may result in personal injury or damage to equipment.

DO NOT STEP on refrigerant lines. Broken lines can whip about and release refrigerant, causing personal injury.

DO NOT climb over a machine. Use platform, catwalk, or staging. Follow safe practices when using ladders.

USE MECHANICAL EQUIPMENT (crane, hoist, etc.) to lift or move inspection covers or other heavy components. Even if components are light, use mechanical equipment when there is a risk of slipping or losing your balance.

BE AWARE that certain automatic start arrangements can ENGAGE THE STARTER, TOWER FAN, OR PUMPS. Open the disconnect ahead of the starter, tower fan, and pumps. Shut off the machine or pump before servicing equipment.

USE only repaired or replacement parts that meet the code requirements of the original equipment.

DO NOT VENT OR DRAIN waterboxes containing industrial brines, liquid, gases, or semisolids without the permission of your process control group.

DO NOT LOOSEN waterbox cover bolts until the waterbox has been completely drained.

DOUBLE-CHECK that coupling nut wrenches, dial indicators, or other items have been removed before rotating any shafts.

DO NOT LOOSEN a packing gland nut before checking that the nut has a positive thread engagement.

PERIODICALLY INSPECT all valves, fittings, and piping for corrosion, rust, leaks, or damage.

PROVIDE A DRAIN connection in the vent line near each pressure relief device to prevent a build-up of condensate or rain water.

DO NOT re-use compressor oil or any oil that has been exposed to the atmosphere. Dispose of oil per local codes and regulations.

DO NOT leave refrigerant system open to air any longer than the actual time required to service the equipment. Seal circuits being serviced and charge with dry nitrogen to prevent oil contamination when timely repairs cannot be completed.

**WARNING**

**CAUTION**

**ABBREVIATIONS AND EXPLANATIONS**

Frequently used abbreviations in this manual include:

- CCM — Chiller Control Module
- DC — Direct Current
- ICVC — International Chiller Visual Controller
- I/O — Inputs/Outputs
- IPWM — Inverter Pulse Width Modulation
- MCB — Main Control Board
- MOV — Metal Oxide Varistor
- SIO — Sensor Input/Output

**Required Publications** — The Carrier VFD option Start-Up and Service Manual must be used with the latest revision of the Start-Up, Operation, and Maintenance Instructions for the 19XRV or 23XRV chiller with PIC III controls.

**Getting Assistance from Eaton** — When calling the numbers listed below, have the following information available:

- Eaton General Order # (GO#)
- Carrier part number
- Eaton serial number

Eaton Care HVAC OEM Support Team 1-800-752-5495
Direct to drives tech support 800-322-4986
Main Eaton Technical Resource Center Number 800-809-2772 (option 6 for drives)
IDENTIFYING DRIVE COMPONENTS

WARNING
DC bus capacitors retain hazardous voltages after input power has been disconnected. After disconnecting input power, wait five (5) minutes for the DC bus capacitors to discharge and then check the voltage with a voltmeter rated for the DC bus voltage to ensure the DC bus capacitors are discharged before touching any internal components. Failure to observe this precaution could result in severe bodily injury or loss of life.

An isolated multimeter will be needed to measure DC bus voltage and to make resistance checks. The drive’s DC bus capacitors retain hazardous voltages after input power has been disconnected.

Check to be sure that the voltage between DC+ and DC− and from each DC terminal to the chassis is zero before proceeding. See Fig. 1A, 1B, and 2.

Components and Application — See Fig. 3 for component identification and Tables 1 and 2 for application by frame size.

Fig. 1A — DC Bus Location (Typical) for Frame CH72 and CH74

Fig. 1B — DC Bus Location (Typical) for Frame CH63

NOTE: DC terminals are on the input end of the CH72 and CH74 drive modules as shown in Fig. 1A. The CH74 drive has 3 modules.

The CH63 drive has 2 modules. The DC bus terminals are located on the top of the module as shown in Fig. 1B while both the input (L1, L2, L3) and output (T1, T2, T3) terminals are located on the bottom of the drive.

The DC bus terminals for all modules are connected to each other (+) to (+) and (−) to (−).

Fig. 2 — Check DC Bus Terminals

**Fig. 3 — Eaton LCX9000 Frame Sizes**
START-UP

Internal components and circuit boards of the drive are live when the drive is connected to incoming power potential. Coming into contact with this voltage is extremely dangerous and will result in severe personal injury or death.

The motor terminals U, V, W and the DC-link-brake resistor terminals B+/R+, R– are live when the drive is connected to incoming power, even if the motor is not running.

Do not make any connections when the drive is connected to the incoming power.

After having disconnected the drive, wait until the indicators on the keypad go out (if no keypad is attached see the indicator through the keypad base). Wait 5 more minutes before doing any work on drive connections. Do not even open the cover before this time has expired.

Before connecting the drive to incoming power, make sure that the switchgear enclosure door is closed.

CAUTION

If other than refrigerant cooling is used, before connecting the drive to incoming power, make sure that the coolant is circulating and has no leaks.

Initial startup of the VFD should be completed by a trained technician certified by Eaton and Carrier as a commissioner for the LCX9000 VFD. Proper commissioning forms should be completed for submission to Eaton. The entire VFD parameter set should be collected using the Eaton XDrive utility program (available from Eaton) and submitted to Eaton as part of standard commissioning.

Wire Lugs — See Table 3 for wire lug sizes. In the case where the incoming power wire size does not fit the standard lug, alternate lugs may be used. Note that lugs rated for a higher current than the circuit breaker may be used.

WARNING

The control I/O-terminals are isolated from the incoming power potential. However, the relay outputs and other I/O terminals may have a dangerous control voltage present even when the drive is disconnected from incoming power. Coming into contact with this voltage could result in severe personal injury.

*Terminal lug is suitable for copper wire only.
Verify Installation — Record the following job information:
1. Job Name
2. Job Number
3. City
4. State
5. Zip Code

Record the following nameplate information:
1. From the VFD nameplate:
   a. VFD Serial Number
   b. VFD Part Number
2. From the machine nameplate (Fig. 4) located at the end of the control panel:
   a. Chiller Serial Number
   b. Chiller Model
   c. Motor rated load amps
   d. Motor nameplate rpm
   e. Motor nameplate kW
   f. Motor nameplate voltage
   g. IPWM (pulse width modulation) frequency
   h. Voltage
3. From the ICVC control panel screen:
   a. Carrier Part Number and Revision
   b. ICVC Software Number

Configure the VFD — All configurations required by the VFD are supplied by the ICVC through the VFD Gateway. Any configuration changes necessary and possible are made on the ICVC screens. A complete set of configurations is transmitted to the VFD each time the controls are powered up.

The following is from the PIC III VFD_CONF screen. Parameters in *italics* are to be entered or confirmed at start-up. Parameters in **bold** are to be changed only after consulting with Carrier service engineering. See Table 4.

*Parameters marked with an * are not downloadable to the VFD but are used in other calculations and algorithms in the ICVC.

**NOTES:**
1. Parameters in *italics* are to be entered or confirmed at start-up.
2. Parameters in **bold** are to be changed only after consultation with service engineering.

Commissioning the Unit — The commission procedure is as follows:

1. If the chiller has been stored outdoors, allow at least 24 hours room temperature stabilization prior to commissioning. Ensure any condensation that occurs as a result of the ambient temperature is allowed to evaporate.
2. Enter parameters in the VFD_CONF screen.
3. Install surge suppression devices if required.
4. Review the power wiring and grounding to ensure that it has been properly connected.
5. Visually examine the inside of the drive enclosure to:
   a. Look for signs of corrosion or moisture residue.
   b. Remove any dirt or debris.
   c. Make sure all vents are clear.
6. Apply power to the drive and take thermal measurements of the power connections. Do this again before start-up.
7. Measure and record the incoming line voltages Vab, Vbc, Vca.

\[
V_{avg} = \frac{(V_{ab} + V_{bc} + V_{ca})}{3}
\]
Pick the line voltage of the greatest difference from the average voltage. Subtract the smaller from the larger to get Vdiff:

\[
\text{Vavg} \times \frac{\text{Vdiff}}{100} = \% \text{ voltage imbalance}
\]

Voltage imbalance must be 2% or less.

8. Take a final thermal measurement of the termination after finalizing the installation to ensure all connections are good.

9. If a ground fault occurs, then do the following:
   a. Turn off and lock out input power. Wait five minutes.
   b. Check for a ground in the motor or motor wiring.
   c. Check for damage to wiring insulation and that wiring is dry.
   d. Verify the motor wiring is separated from ground and there is no connection between phases.
   e. Check for failed IGBTs.

10. If an Overcurrent fault occurs, then do the following:
    a. Turn off and lock out input power. Wait five minutes.
    b. Check for excessive load and verify load limit settings on the ICVC.
    c. Check motor and wiring insulation.
    d. Check parameter settings on VFD_CONF screen in the ICVC.

**Check Configuration Jumpers** — Check that configuration jumpers are as shown in Fig. 5.

**SERVICE**

**WARNING**

DC bus capacitors retain hazardous voltages after input power has been disconnected. After disconnecting input power, wait five (5) minutes for the DC bus capacitors to discharge and then check the voltage with a voltmeter to ensure the DC bus capacitors are discharged before touching any internal components. Failure to observe this precaution could result in severe bodily injury or loss of life.

**Troubleshooting the Drive** — The drive can display two kinds of error codes on the ICVC called the Alert and Alarm codes. These codes signal a problem detected during self tuning or drive operation. Alert and Alarm codes are located in the 19XRV or 23XRV Start-Up, Operation and Maintenance Instructions.

- A warning message on the ICVC is an ALERT.
- The same warning viewed with the Eaton 9000x software tool is a VFD ALARM.
- A failure resulting in a shutdown is seen as an ALARM on the ICVC and as a VFD FAULT when viewed with Eaton 9000x software.

**CONDITION CODES**

ICVC ALERT = VFD ALARM
ICVC ALARM = VFD FAULT

The ICVC displays the Eaton code in the VFD HIST screen. Other ICVC screens will display the ICVC codes. Eaton codes that do not have a corresponding ICVC code will appear on the ICVC default and Alarm history screens as code 206. The fault can be identified by the Eaton code in the VFD_HIST screen.

**ICVC ALERT CODES** — An alert condition is indicated by a message at the top of the ICVC default screen. In addition, an exclamation point (!) will appear next to any affected point on an ICVC display screen. The drive will continue to operate during the alert condition. Investigate the cause of the alert to ensure it does not lead to a fault condition. The alert code will automatically be cleared from the ICVC when the condition causing the alert no longer exists.

**ICVC ALARM CODES** — An alert condition is also indicated by a message at the top of the ICVC default screen. An alarm occurs, the drive coasts to stop and the RUN LED on the keypad will turn off. The detected fault message is maintained on the display until it is cleared by pressing the RESET softkey. For Eaton default code descriptions, see Table 5.

**TEST EQUIPMENT NEEDED TO TROUBLESHOOT** — An isolated multimeter adequately rated for the DC bus voltage will be needed to measure DC bus voltage and to make resistance checks. Note that dedicated troubleshooting test points are not provided.

**VERIFYING THAT DC BUS CAPACITORS ARE DISCHARGED** — The drive’s DC bus capacitors retain hazardous voltages after input power has been disconnected. Perform the following steps before touching any internal components:

1. Turn off and lock out input power. Wait five minutes.
2. Verify that there is no voltage at the drive’s input power terminals.
3. Measure the DC bus potential with a voltmeter while standing on a non-conductive surface and wearing insulated gloves (1000 V). Measure the DC bus potential. See Fig. 1. The voltage between DC+ and DC−, and from each DC terminal to the chassis must be zero before proceeding.
4. Once the drive has been serviced, reapply input power.
HIGH TEMPERATURE ALARMS — Coolant flow through the cold plate is controlled by an orifice in the refrigerant line leaving the cold plate. The orifice looks like one of the O-ring face seal connectors and in fact is used as one of the connections on the coolant tubing. The difference is that the passage through the fitting is 0.375 in. (9.5 mm). If the orifice is present and condenser liquid flow is present, the liquid will flash to cooler temperature at the orifice. This temperature difference is great enough to be easily felt.

MAIN CONTROL BOARD (MCB) COMPONENTS — Refer to Fig. 6 for the location at the I/O board and relay boards which are installed in slots A-D. The OPTCC communication board is installed in slot E. Typical wiring schematics are shown in Appendix A.

Fig. 6 — Basic and Option Board Connections of the Control Board

Checking Power Modules and Motor Input with Input Power Off — Use the following procedure to check the drive’s power module circuitry with power off:
1. Turn off and lock out input power. Wait five minutes.
2. Verify there is no voltage at the drive’s input power terminals.
3. Using a voltmeter, check the DC bus potential as described in Fig. 7 to ensure the DC bus capacitors are discharged.
4. Disconnect the motor from the drive.
5. Check all AC line and DC bus fuses.
6. Check motor impedance.
7. Reconnect the motor to the drive.
8. Reapply input power.

Fig. 7 — Check DC Bus Terminals

Servicing the Drive

WARNING

To guard against possible personal injury and/or equipment damage:
1. Inspect all lifting hardware for proper attachment before lifting drive.
2. Do not allow any part of the drive or lifting mechanism to make contact with electrically charged conductors or components.
3. Do not subject the drive to high rates of acceleration or deceleration while transporting to the mounting location or when lifting.

WARNING

DC bus capacitors retain hazardous voltages after input power has been disconnected. After disconnecting input power, wait five (5) minutes for the DC bus capacitors to discharge and then check the voltage with a voltmeter to ensure the DC bus capacitors are discharged before touching any internal components. Failure to observe this precaution could result in severe bodily injury or loss of life.

REMOVING THE DRIVE FROM THE ENCLOSURE — The weights specified must be taken into consideration when removing the drive. All lifting equipment and lifting components (hooks, bolts, lifts, slings, chains, etc.) must be properly sized and rated to safely lift and hold the weight of the drive while removing it. The drive weights are as follows:
- Drive weight for CH72: 198 lb
- Drive weight for CH63: 264 lb
- Drive weight for CH74: 617 lb
Frame CH72 — Refer to Fig. 8A and 8B. Frame CH72 has one drive module which is mounted horizontally to the bottom surface of the enclosure. The input end of the module is on the left and the output end is on the right.

To remove the drive:
1. Remove all power cabling from the top power connections bus bars.
2. Remove all power bussing from the bottom power connections bus bars.
3. Close refrigerant cooling isolation valves. Remove the two refrigerant lines (supply and return) from the output end of the drive.
4. Remove the cabinet center door bracket.
5. Remove the bolts holding the drive chassis to the cabinet.
6. Attach tag lines to the handles to prevent the drive from swinging as it is lifted free of the cabinet bottom.
7. Connect lifting chains to the handles at the left and right sides of the drive (as mounted).
8. Lift the drive with the hoist.

To reinstall the drive chassis, reverse the above procedure.

Frames CH63 and CH74 — Refer to Fig. 9.
Frame CH63 has 2 modules on the chassis. The chassis is held to the two Z brackets by two bolts in each bracket.
Frame CH74 has 3 modules on the chassis. The chassis is held to the two Z brackets by four bolts in each bracket.

To remove the drive:
1. Remove all power cabling from the top power connections bus bars.
2. Remove all power bussing from the bottom power connections bus bars.
3. Close refrigerant cooling isolation valves. Remove the two refrigerant lines (supply and return) from the bottom of the drive.
4. Remove the cabinet ceiling and center door bracket.
5. Connect lifting chains to the top two 1.15-in. diam lifting holes.
6. Lift hoist until chains have slight tension.
7. Loosen and remove bolts that hold the bottom of the drive to the Z bracket (2 bolts on CH63, 4 bolts on CH74).
8. Loosen the 2 or 4 bolts that hold the top of the drive to the Z bracket. The drive may drop down a little to rest on the top Z bracket.
9. Lift the drive chassis with the hoist until the chassis is free from the Z bracket. Remove the 2 or 4 top bolts.
10. Pull the drive forward of the Z bracket and lift the drive chassis from the cabinet.

To reinstall the drive chassis, reverse the above procedure.
Tighten terminal bolts to the torque shown in table below.

* Programmable fault.
† Alarm fault. This type of fault is a sign of unusual operating condition. It does not cause the drive to stop, nor does it require any special actions. The alarm fault remains in the display for ~30 seconds.

NOTES:
1. ICVC fault in ( ) indicates fault shown when Auto-restart is enabled.
2. When the ICVC Fault State is 206 the fault code must be read from the drive keypad or with the 9000X software tool.

* Programmable fault.
† Alarm fault. This type of fault is a sign of unusual operating condition. It does not cause the drive to stop, nor does it require any special actions. The alarm fault remains in the display for ~30 seconds.

**NOTES:**
1. ICVC fault in ( ) indicates fault shown when Auto-restart is enabled.
2. When the ICVC Fault State is 206 the fault code must be read from the drive keypad or with the 9000X software tool.
Parts Identification and Location
See Fig. 10A-11B.

Fig. 10A — Frame CH72 Component Identification — 19XRV
LEGEND

1 — Inverter (198 lb; 416 or 502 amp)
2 — Line Choke, 3% nominal impedance (414 amp reactor, 98 lb; 515 amp reactor, 175 lb)
3 — Main Breaker Kit
4 — Control Transformer (53 lb)
5 — Oil Heater Circuit Breaker, CB2 (15 amp)
6 — I/O Cards
7 — Communication Card (ICVC)
8 — Fuse, 25 amp, 250 v
9 — Fuse Block, 30 amp, 250 v
10 — Meter Kit
11 — Control Transformer
12 — Voltmeter, 0 to 600 vac scale
13 — Camswitch, 4-position (voltmeter)
14 — Camswitch, 4-position (ammeter)
15 — Ammeter, 0 to 600 amp scale (0 to 5 amp)
